

Why do we need to ensure information continuety?

Brain Aneurysm Foundation (Lithuania)

Case study

Why do we need to ensure information continuety?

People will identify themselves as being at risk

People will be diagnosed with unruptured intracranial aneurysms

_

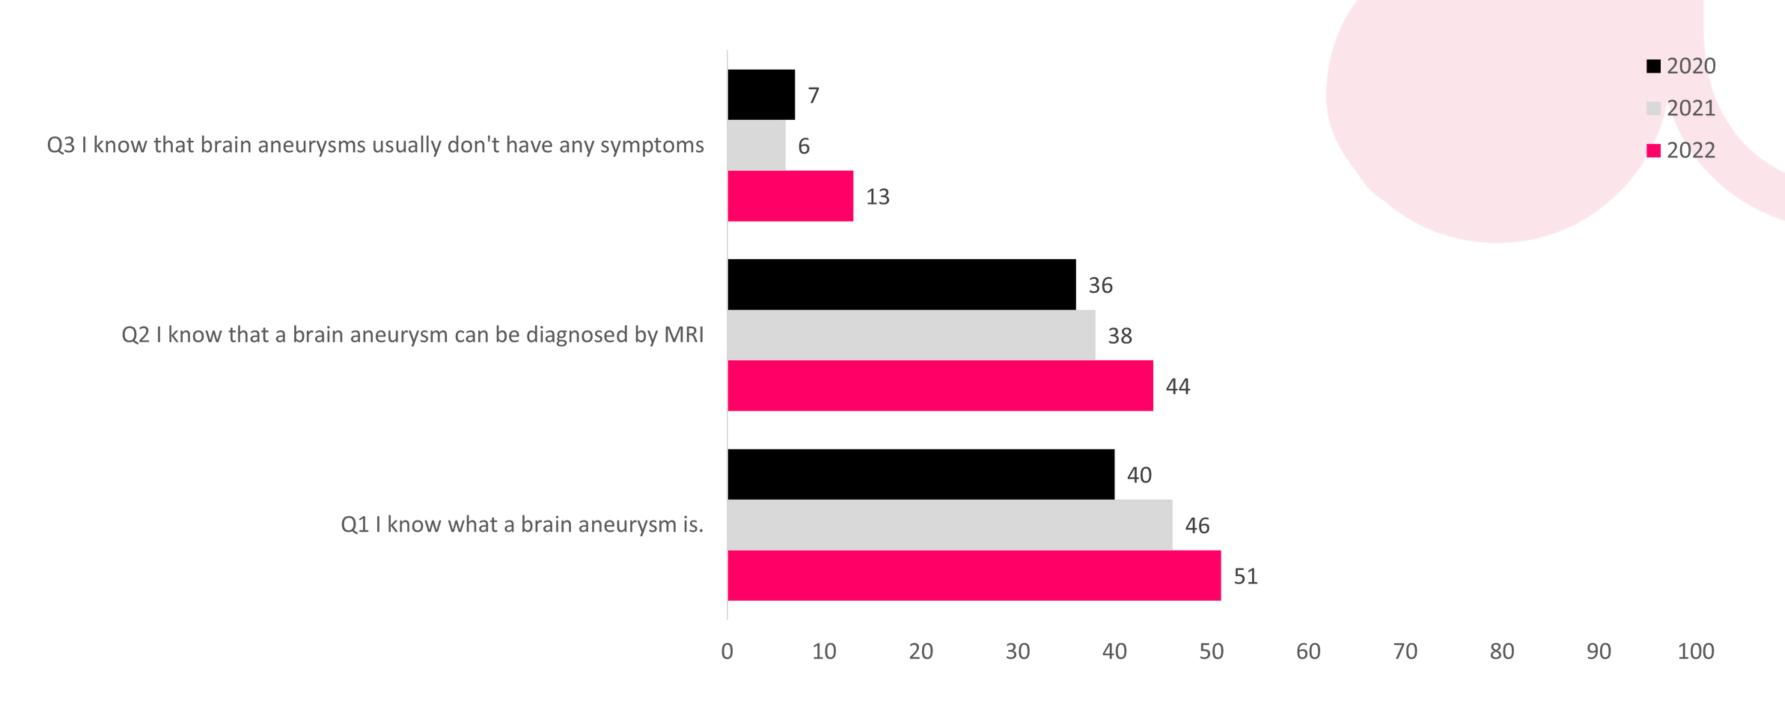

Scientific material will be collected

The patient pathway will be improved

Lives will be saved

People will identify themselves as being at risk

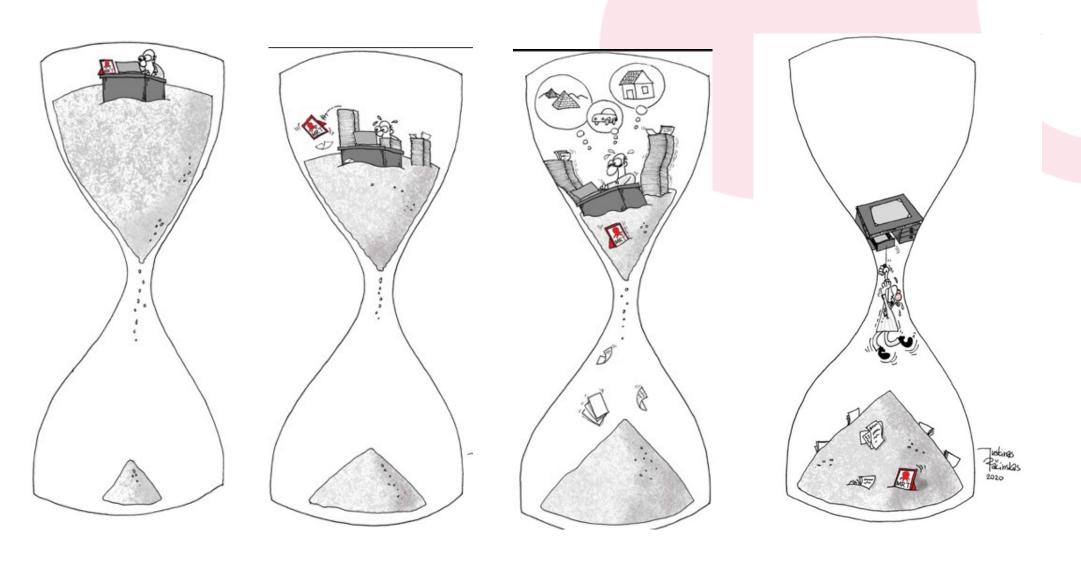

Results of a representative survey of the population (% rate of the respondents)

People will be diagnosed with unruptured intracranial aneurysms

Knowing that a person has a brain aneurysm does not encourage him to urgently consult an interventional radiologist or a neurosurgeon: he does not feel any pain, and his health status may not change even for several years. Therefore, after an MRI, a person gets into the routine of his life and does not evaluate the possible consequences if the brain aneurysm ruptures.

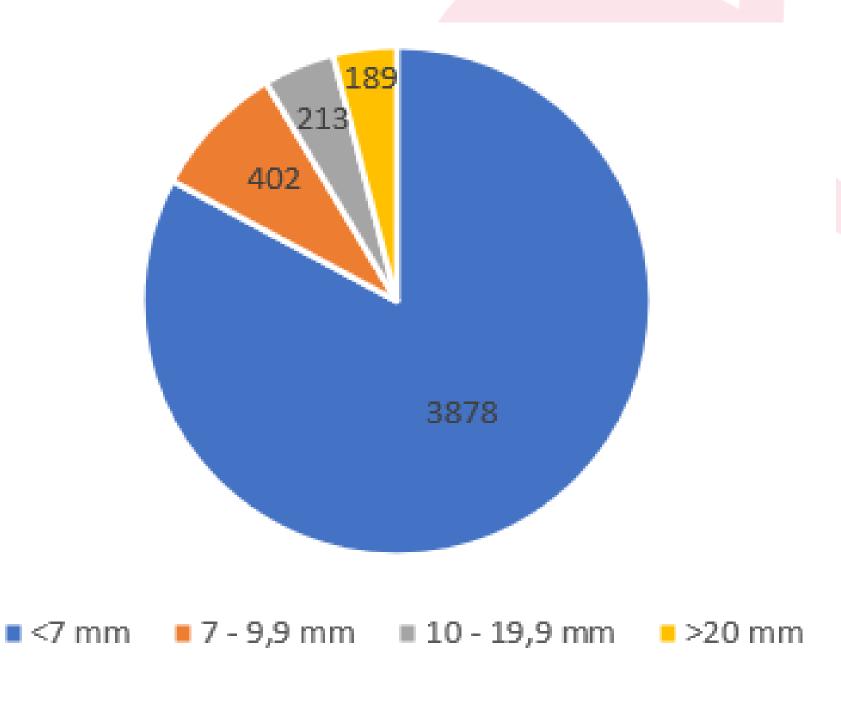

The Brain aneurysm foundation aims to increase people's awareness and to explain to them that monitoring is also a part of treatment, so it should be done regularly and responsibly.

Scientific material and data will be collected

PHASES risk prediction score:

- 4682 users filled out the anonymous questionnaire*;
- 1295 people marked that they know the exact spot, where their aneurysm is;
- The number of respondents who indicated the size of the brain aneurysm they had:

Scientific material and data will be collected

- Representative Survey of the Population (the years 2020, 2021, and 2022; respondents - approx. 1000).
- Structured information on www.smegenuaneurzima.lt about the disease, symptoms, risks, and treatments.

Results:

- Via Facebook, we reached 578,538 users with information about brain aneurysms
- Via Google, we reached 1519 540 users and 29 519 users clicked on www.smegenuaneurizma.lt (Lithuania, 2021 September 2022 July).

Scientific material and data will be collected

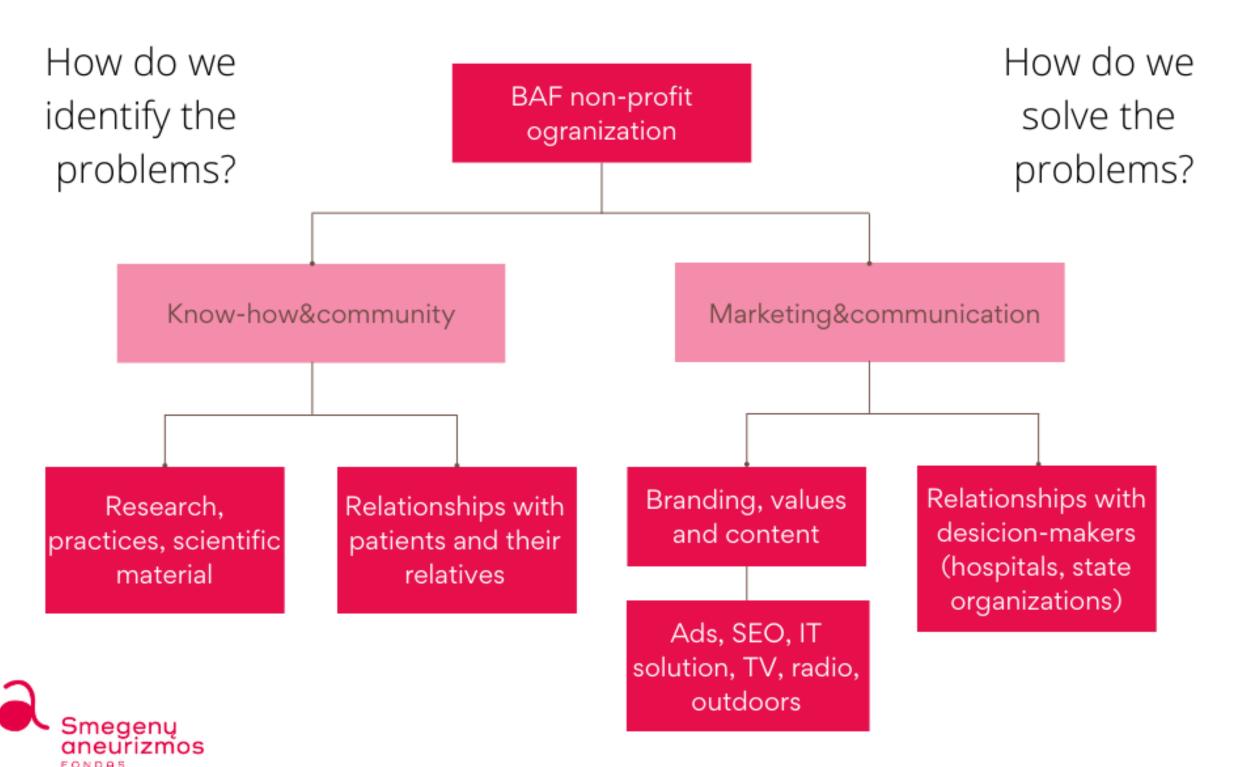

The patient pathway will be improved

Lives will be saved

Jolanta Pieškuvienė

Monika Paltarackiene Taip mąstyti nedera. Būtina embolizuoti tuos "balionėlius",jums kyla didelis pavojus. Man plyšo vienas, embolizavo, gyvenu pilnavertį gyvenimą. Dėkinga RVUL intervencinės radiologijos skyriaus gydytojui A.Afanasjevui ir skyriaus vedėjui A.Širvinskui

Dalia Janulyte

jei laiku yra diagnozuota, viskas bus gerai, to ir linkiu, nes.....pati esu tai patyrusi,gyvybę išgelbėjo profesionalūs neurochirurgai(grb.Gružas ir grb.Pranciulis), bet....liko fizinė negalia, nes....pirma pagalba buvo uždelsta(buvau viena namuose).

Nadezda Radzeviciene

Ačiū nuostabiam daktarui Gerb.A.Širvinskui už man atliktą sėkmingai aneurizmos embolizaciją. Nesiryžau trepanavimui, nes buvo buvo žiauriai baisu.o embolizacija truko mažiau valandos.kitą dieną jau vaikščiojau.jokių pasekmių nebuvo. Labai gaila. kad specialistai (neurologai).siunčia tik pas neurochirurgus ir net nežino apie kitą gydimo būdą.embolizaciją.Gyvenu įprastą man gyvenimą.be jokių apribojimų.Sekmės visiems!!!!!
